Flexible Modelling

Flexible modeling is one of the key characteristics as the product/process/services are modular to exhibit an insight into configurations as guiding information for designers. The designer utilizes tangible information provided through mock artifacts and use scenarios within the iterative sketching, modeling process, and guiding inspiration for generative concept development. The plan for over the lifetime of product/process/service could be mapped with the probable consequences including economic, social, environmental, political, emotional, and personal.

Configuration 1
(A B C E)

Configuration 2
(C F)

Configuration 3
(A C D E)
